HOMEPAGE DASHBOARD

Currently Sales Dashboard and Homepage dashboards are the same. We need the homepage dashboard to be different. Follow this:

Any order placed through **Online Orders** or **Field Sales Orders** automatically enters the **Fulfillment** pipeline at the **Picking** stage — no manual routing needed."

Source tagging requirement:

"Every order that enters Fulfillment must retain a visible **source tag** indicating whether it came from **Online Orders** or **Field Sales Orders**. This tag should be:

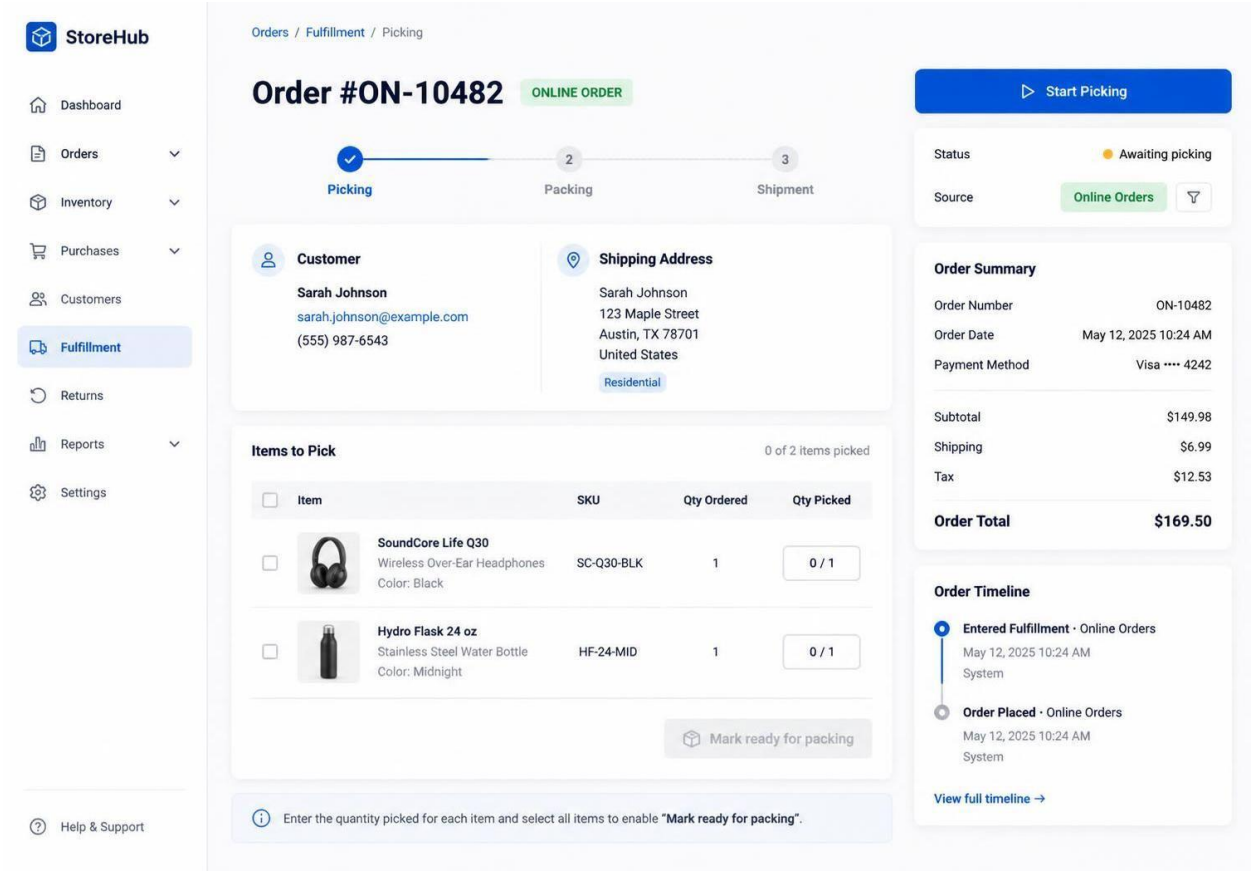

- Stored on the order record itself (e.g., an order_source field), not just inferred

- Displayed on the Fulfillment views (Picking, Packing, Shipment) as a badge or label next to each order
- Filterable — staff should be able to filter the Fulfillment queue by source (e.g., view only Online Orders awaiting picking)"

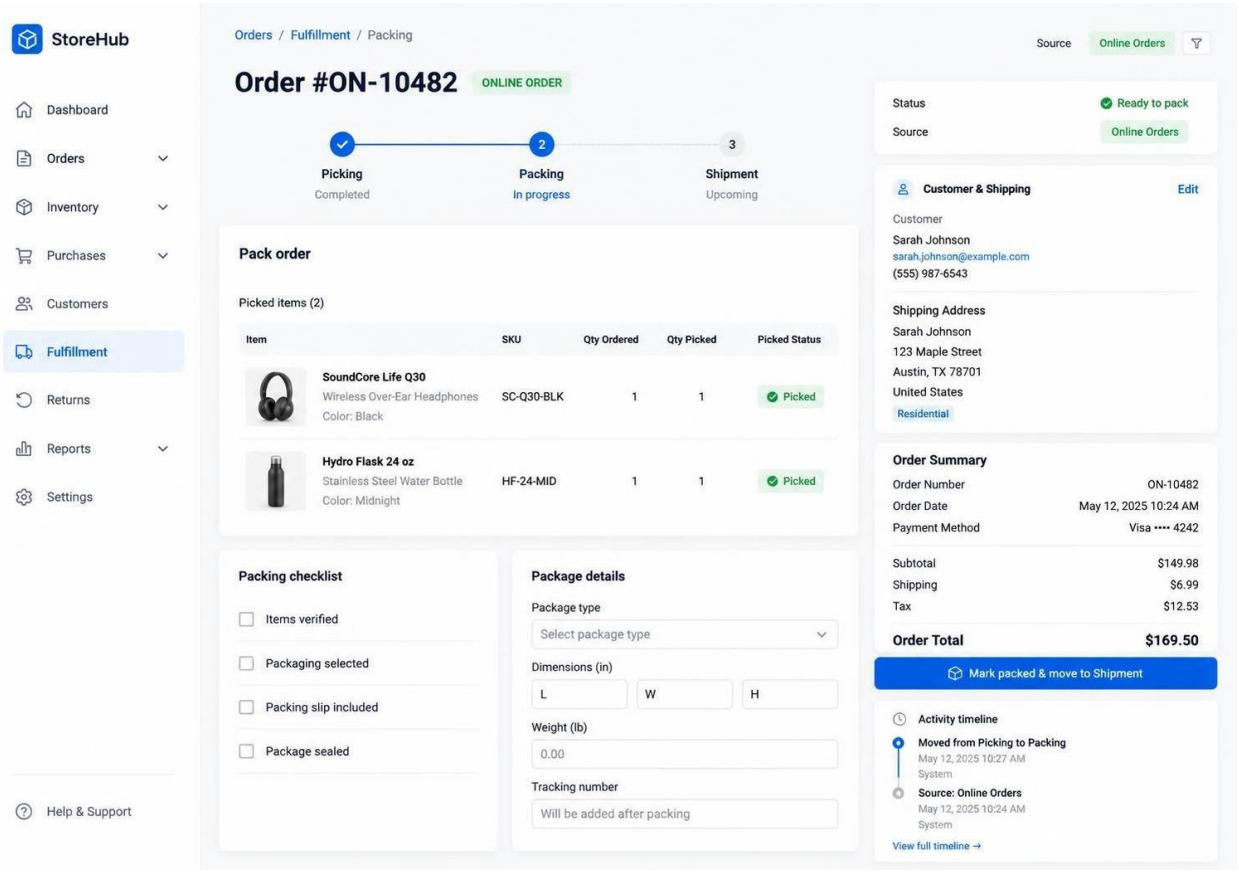

Stage-by-stage flow:

1. **Picking** — Order lands here first, tagged with its source. Warehouse staff picks the items and marks it ready.
2. **Packing** — Once picked, order advances to Packing, source tag still visible.
3. **Shipment** — Once packed, order moves to Shipment. This is the final stage — order is complete once shipped.

- **Taxes & Compliance**
    - Tax Report
    - MSA Tobacco Report
- **Employees & Activity**
    - Time Clock
    - Sales Representatives
    - Activity Log

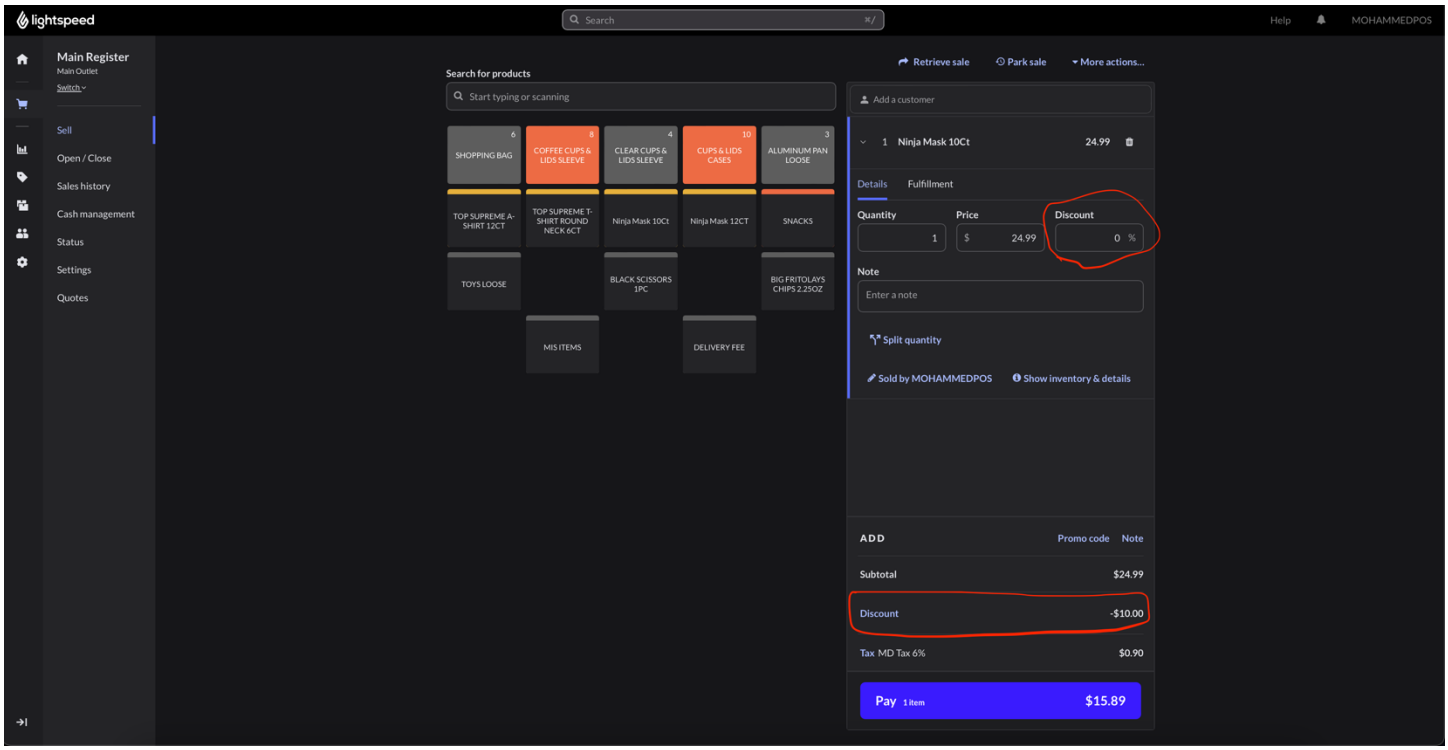

Everything above is completed. Except Reports. I have yet to evaluate it.

New Requirements- (09/03/2026)

The following requirement is for Prime Plus. But we can apply it to everyone because these are some good pointers:

1. Supplier name is in the Brand
    a. This is how it is right now. Its wrong (Prime Plus)

2. We want to show discount to apply in the invoices and POS

   a. In our one we have the discount. But its not showing up.

3. Add stock in “Add New Product”
   a. Yes, we have the option to add stock once we click on “Save & Add Opening Stock” But Prime Plus requested if we can have a box where we add the stock so they don’t need to go to click on anything else. They can do it smoothly in one page.

4. **Feature: Unit-of-Measure (UoM) Conversion & Pricing**

   Problem: Right now, "Unit" (Box/Pcs) and "Quantity" are treated as flat fields. We need the system to understand the *relationship* between units — how many pieces are in a box — so it can price and sell at either level.

   Example:

   - Product: KitKat
   - Base unit: Pcs
   - Packaging unit: Box
   - Conversion: 1 Box = 10 Pcs
   - Box price: $10.00 → system should auto-calculate Pcs price: $1.00 (or allow manual override)
   - At checkout: selling 1 Box = $10.00, selling 1 Pcs = $1.00, selling 3 Pcs = $3.00

   What needs to change on "Add New Product":

- **Base Unit field** — the smallest sellable unit (e.g., Pcs). This is what stock is tracked in internally.
- **Purchase/Packaging Unit field** — the bulk unit (e.g., Box, Case, Carton).
- **Conversion Factor field** — numeric input: "1 [Packaging Unit] = ___ [Base Unit]" (e.g., 1 Box = 10 Pcs).
- **Price per unit** — allow entering price at either level:
    1. Enter Box price → system auto-computes Pcs price (Box price ÷ conversion factor)
    2. Or enter Pcs price → system auto-computes Box price (Pcs price × conversion factor)
    3. Should allow manual override in case bulk pricing isn't a clean multiple (e.g., box discount).

What needs to change at checkout/POS screen:

- Cashier selects the product, then selects which unit they're selling in (Box or Pcs) via a toggle/dropdown.
- System pulls the correct price for that unit automatically.
- **Inventory deduction must happen in base units** — selling 1 Box deducts 10 Pcs from stock, selling 3 Pcs deducts 3 Pcs from stock. This keeps one source of truth for stock count regardless of which unit was sold.

Sales App: (Ask me for login information for OIS Pro tomorrow)
